Date:2023-04-08

2022-2026-CSE-B

Aim:

S.No: 7

Write a program to <u>search</u> the given element from a list of elements with <u>binary search</u> technique using **recursion**.

At the time of execution, the program should print the message on the console as:

```
Enter value of n :
```

For example, if the user gives the input as:

```
Enter value of n : 5
```

Next, the program should print the following messages one by one on the console as:

```
Enter 5 elements :
```

if the user gives the **input** as:

```
Enter 5 elements : 33 55 22 44 11
```

then the program should **print** the result as:

```
After sorting the elements are : 11 22 33 44 55
```

Next, the program should print the message on the console as:

```
Enter key element :
```

if the user gives the input as:

```
Enter key element : 11
```

then the program should **print** the result as:

```
The given key element 11 is found at position : 0 \,
```

Similarly, if the key element is given as 18 for the above example then the program should print the output as:

```
The given key element 18 is not found
```

Note: Write the functions read(), bubbleSort(), display() and binarySearch() in Program912a.c

Source Code:

Program912.c

```
#include <stdio.h>
#include "Program912a.c"

void main() {
   int a[20], n, key, flag;
   printf("Enter value of n : ");
   scanf("%d", &n);
   read(a, n);
   bubbleSort(a, n);
```

```
printf("After sorting the elements are : ");
  display(a, n);
  printf("Enter key element : ");
  scanf("%d", &key);
  flag = binarySearch(a, 0, n - 1, key);
  if (flag == -1) {
     printf("The given key element %d is not found\n", key);
  } else {
     printf("The given key element %d is found at position : %d\n", key, flag);
  }
}
```

Program912a.c

```
void read(int a[],int n)
   int i;
   printf("Enter %d elements : ",n);
   for(i=0;i<n;i++)</pre>
   scanf("%d",&a[i]);
void bubbleSort(int a[],int n)
   int i,j,temp;
   for(i=0;i<n-1;i++)</pre>
      for(j=0;j<n-1;j++)
         if(a[j]>a[j+1])
            temp=a[j];
            a[j]=a[j+1];
            a[j+1]=temp;
         }
      }
   }
}
void display(int a[],int n)
   int i;
   for(i=0;i<n;i++)</pre>
   printf("%d ",a[i]);
   printf("\n");
int binarySearch(int a[],int l,int h,int key)
   int mid,flag;
   if(1>h)
   return -1;
   else
      mid=(1+h)/2;
      if(a[mid]==key)
         flag=mid;
```

```
return flag;
      }
      else
      {
          if(a[mid]<key)</pre>
         binarySearch(a,mid+1,h,key);
         else
         binarySearch(a,l,mid-1,key);
      }
   }
}
```

Execution Results - All test cases have succeeded!

```
Test Case - 1
User Output
Enter value of n : 5
Enter 5 elements : 33 55 22 44 11
After sorting the elements are : 11 22 33 44 55 11
Enter key element : 11
The given key element 11 is found at position : 0
```

```
Test Case - 2
User Output
Enter value of n : 4
Enter 4 elements : 23 67 45 18
After sorting the elements are : 18 23 45 67 24
Enter key element : 24
The given key element 24 is not found
```

```
Test Case - 3
User Output
Enter value of n : 6
Enter 6 elements : 10 20 18 9 11 15
After sorting the elements are : 9 10 11 15 18 20 18
Enter key element : 18
The given key element 18 is found at position : 4
```
